

HOME SOC LAB — TECHNICAL EVIDENCE BRIEF

Wazuh SIEM • Kali Linux • Windows Security • FIM • SMB • Detection Validation

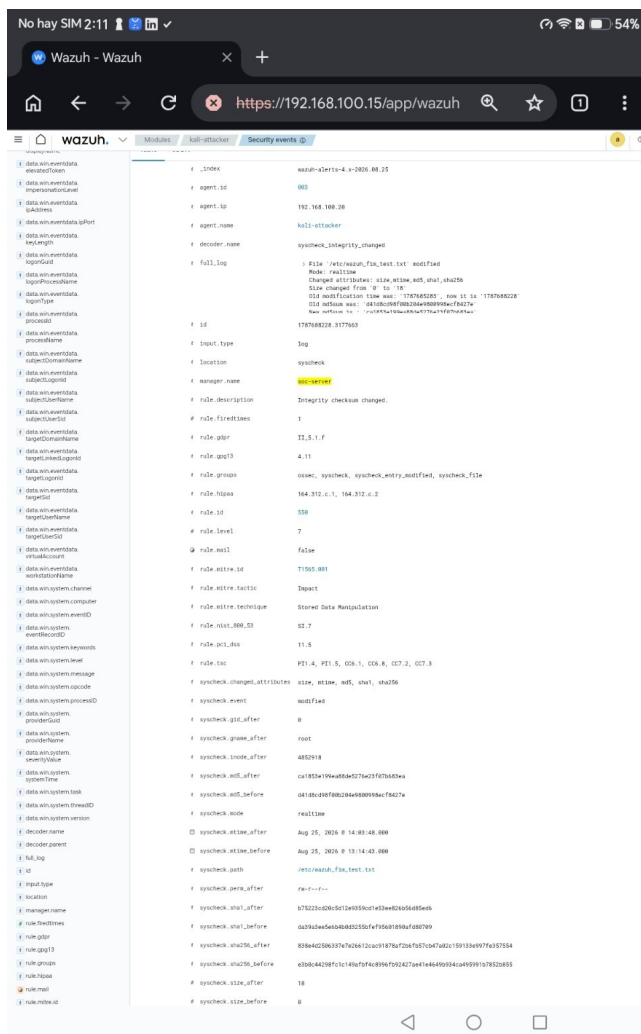

What I built

A reproducible home SOC lab with Wazuh Manager/Indexer/Dashboard on Ubuntu Server, monitored Kali Linux and Windows endpoints, plus network and infrastructure monitoring components. The project is backed by a detailed master manual and a technical runbook for rebuild and repeatable testing.

System	Role	Validated state
SOC-server	Wazuh SIEM	Manager / Indexer / Dashboard operational
kali-attacker	Controlled source + agent 003	Active; FIM evidence
Laptopwindows	Target + agent 004	Active; Windows Security telemetry

Evidence 1 — File Integrity Monitoring in realtime

A controlled modification of /etc/wazuh_fim_test.txt on Kali was detected by Wazuh in realtime. The event records syscheck_integrity_changed, rule 550, Level 7, syscheck.event=modified and MITRE T1565.001.

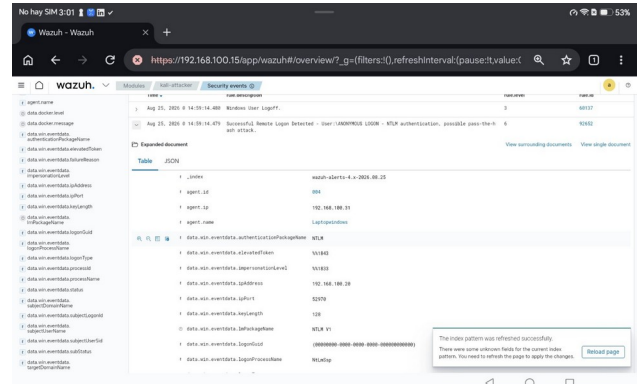

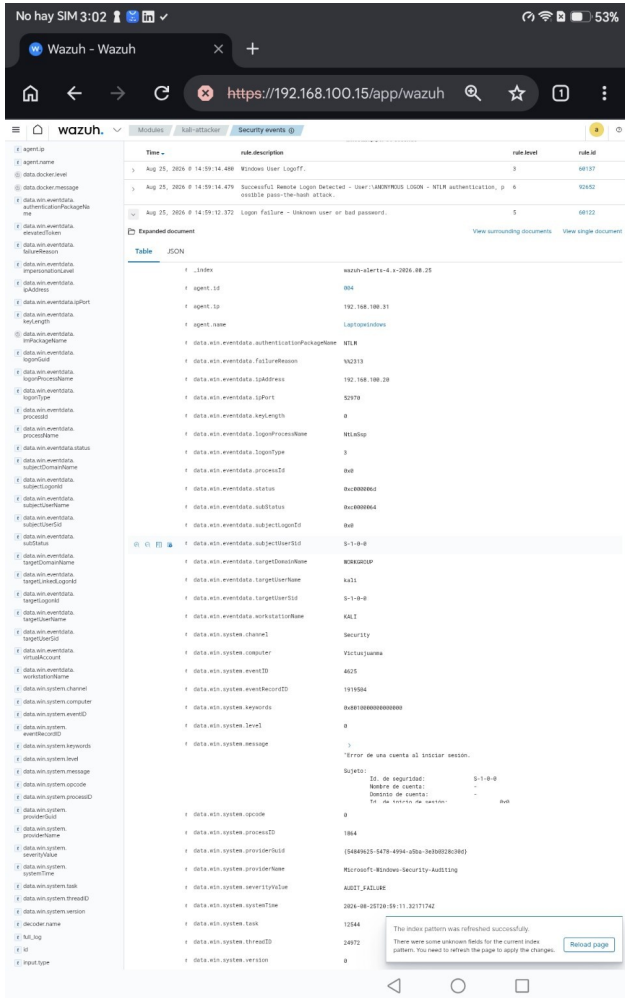

Actual lab evidence — kali-attacker (003), /etc/wazuh_fim_test.txt, Mode: realtime, rule 550, Level 7.

REMOTE AUTHENTICATION — KALI → SMB → WINDOWS → WAZUH

Evidence 2 — Controlled SMB authentication

From Kali (192.168.100.20), I connected to the Windows SMB service on 192.168.100.31 and performed two controlled authentication attempts with smbclient. Both were rejected with NT_STATUS_ACCESS_DENIED. Windows/Wazuh telemetry correlated the activity to the Kali source using network logon fields.

Actual lab evidence — left: 4625 / rule 60122 / Level 5 / source 192.168.100.20 / Logon Type 3 / user kali. Right: remote logon detection / rule 92652 / Level 6 / NTLM / same source IP.

What the evidence demonstrates

- Endpoint telemetry and SIEM event triage across Linux and Windows.
- File Integrity Monitoring validation with a real modified file and rule-level evidence.
- Network/service troubleshooting: TCP/445 reachability, Windows firewall state and SMB authentication.
- Correlation using source IP, Logon Type, username, Windows Event ID and Wazuh rule metadata.
- Repeatable documentation: Master Manual + Technical Runbook + screenshots from the actual executions.

Technical interview proof

I can walk through the full build, reproduce the tests, show the underlying Wazuh events, and explain the troubleshooting decisions. The screenshots above are from the actual lab executions on 25 Aug 2026, not stock examples or reused evidence from another test.
